

## What we mean for green economy?

The green economy is one that results in reducing environmental risks and ecological scarcities.

Green economy is an economic development model based on sustainable development and a knowledge of ecological economics.

The objectives of the green economy are:

- use of renewable energy against of those fossil
- increased efficiency in the use of energy resources
- reducing emissions of carbon dioxide and pollutants in the environment
- reducing the production of waste and the environmental impact to human activities
- preservation of the biodiversity and different ecosystem.

Renewable energies are:

- wind power
- hydropower
- solar power.

With recycling we can convert almost all materials in new objects.

**If we don't use renewable energies and we don't recycle we contribute to the increase of global warming.**
